

Purpose:

To investigate what happens to the vitamin C in fruit juice when it is heated to 20, 40, 60, and 80 degrees Celsius for 10 minutes.

①

Calculations:

Part A – calculation of blank titration:

$$V(\text{S}_2\text{O}_3^{2-}) = 0.02925$$

$$n(\text{S}_2\text{O}_3^{2-}) = 0.0511 \times 0.02925 = 1.49 \times 10^{-3}$$

$$n(\text{I}_2 \text{ total}) = \frac{1}{2} \times 1.49 \times 10^{-3} = 7.47 \times 10^{-4}$$

Part B – calculation of back titration:

20°C

$$n(\text{I}_2) = 7.47 \times 10^{-4}$$

$$n(\text{S}_2\text{O}_3^{2-}) = 0.01 \times 0.0182 \quad n(\text{S}_2\text{O}_3^{2-}) = 1.82 \times 10^{-4}$$

$$n(\text{I}_2 \text{ remaining}) = \frac{1}{2} \times 1.82 \times 10^{-4} = 0.91 \times 10^{-4}$$

②

$$n(\text{I}_2 \text{ reacted with vit C}) = n(\text{I}_2 \text{ remaining}) = 7.47 \times 10^{-4} - 0.91 \times 10^{-4} = .656 \times 10^{-4} \text{ mol} =$$

$n(\text{vitamin C})$

$$c(\text{vitamin C}) = n/V = .656 \times 10^{-4} / 0.1 = 0.656 \times 10^{-3}$$

Conclusion:

As the temperature is increased the volume of thiosulfate needed increases.

③
