

Architect Influence

Concepts

1

This design uses high arched lines which mirror Niemeyer's opinion of "disregarding the right angle", this is aesthetically pleasing to the chosen design environment because it creates a natural look to the design. I feel that the lines are more organic and the forest environment is designed to be damp and the lines of the roof of this design will allow water to flow off it easily and not sit on it as it would do for a flat roofed design.

This design shows relation to my designer, Niemeyer through its curved lines and the operation of concrete as the main building material. However I feel that although the building has these elements it lacks the originality of Niemeyer's designs. If I was to develop this design I would like to make the building less symmetrical and create a focal point for it.

I feel that the lines used in this design have created a flow to the design, meaning that the design relates to Niemeyer's philosophy of "form follows function". The idea of an internal courtyard with a retracting roof means that all rooms in the house can open up to it, so the outside environment should be captured so that the rooms have a modern, airy feeling to them. This design feature would also mean that the house had a connection point and it would feel unified.

FLOOR PLAN

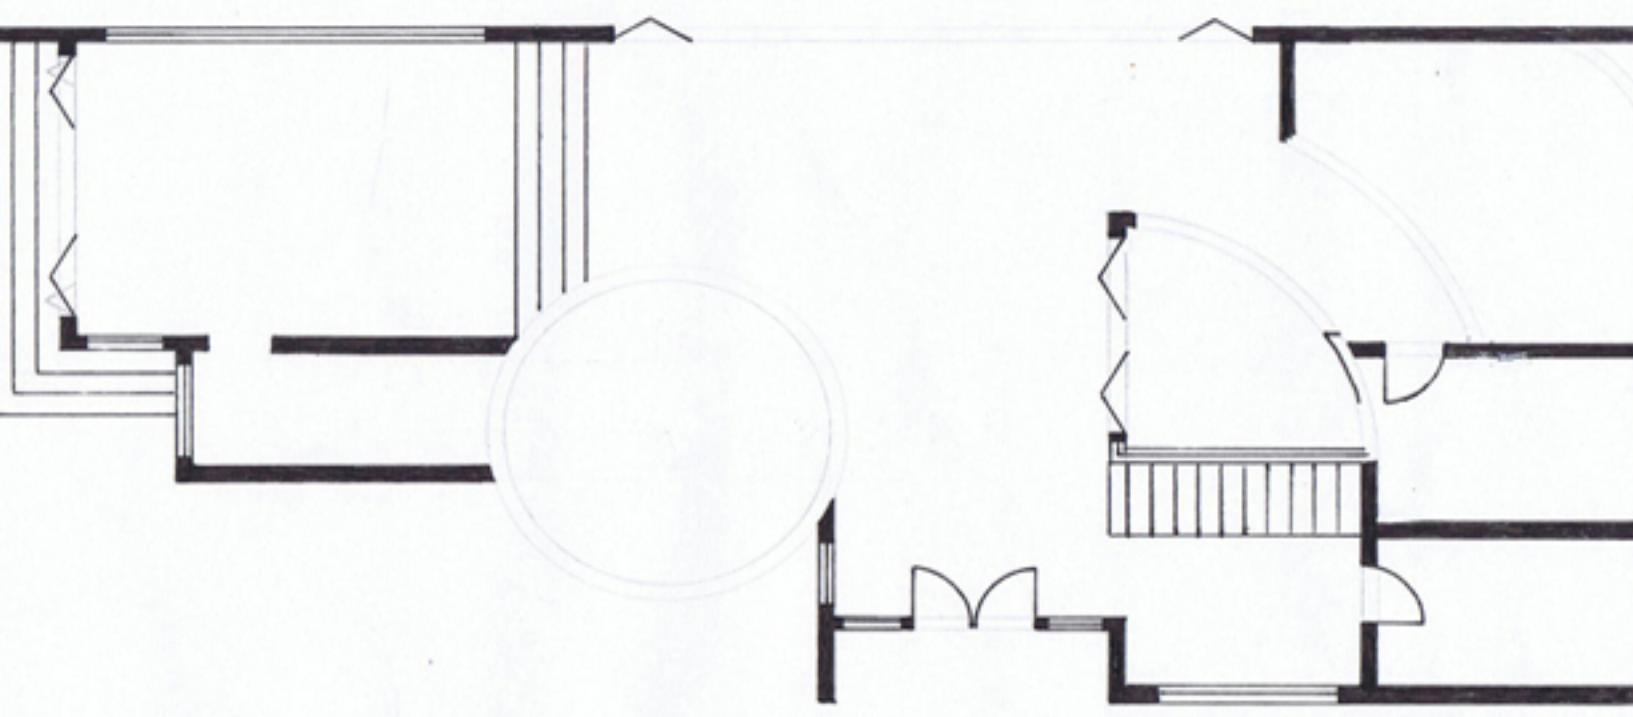

In this design I have integrated the social areas of the house with the bedrooms, this was designed the house to have large open doors and glass windows which open up to the outdoors increasing lightness and airiness into the house. The rooms visually connect and engage to the outdoors, even on rainy days. This emphasizes the natural environment that the house is situated in and gives an alluring feel to the house. The curves of the roof soften the design into the environment. The curved back wall enables the house to settle into the bush environment more easily and gives the house a natural appeal. This house has good circulation/easiness of movement because the central area of the house is the living/dining area which is often considered the 'heart' of the house.

DEVELOPMENTS

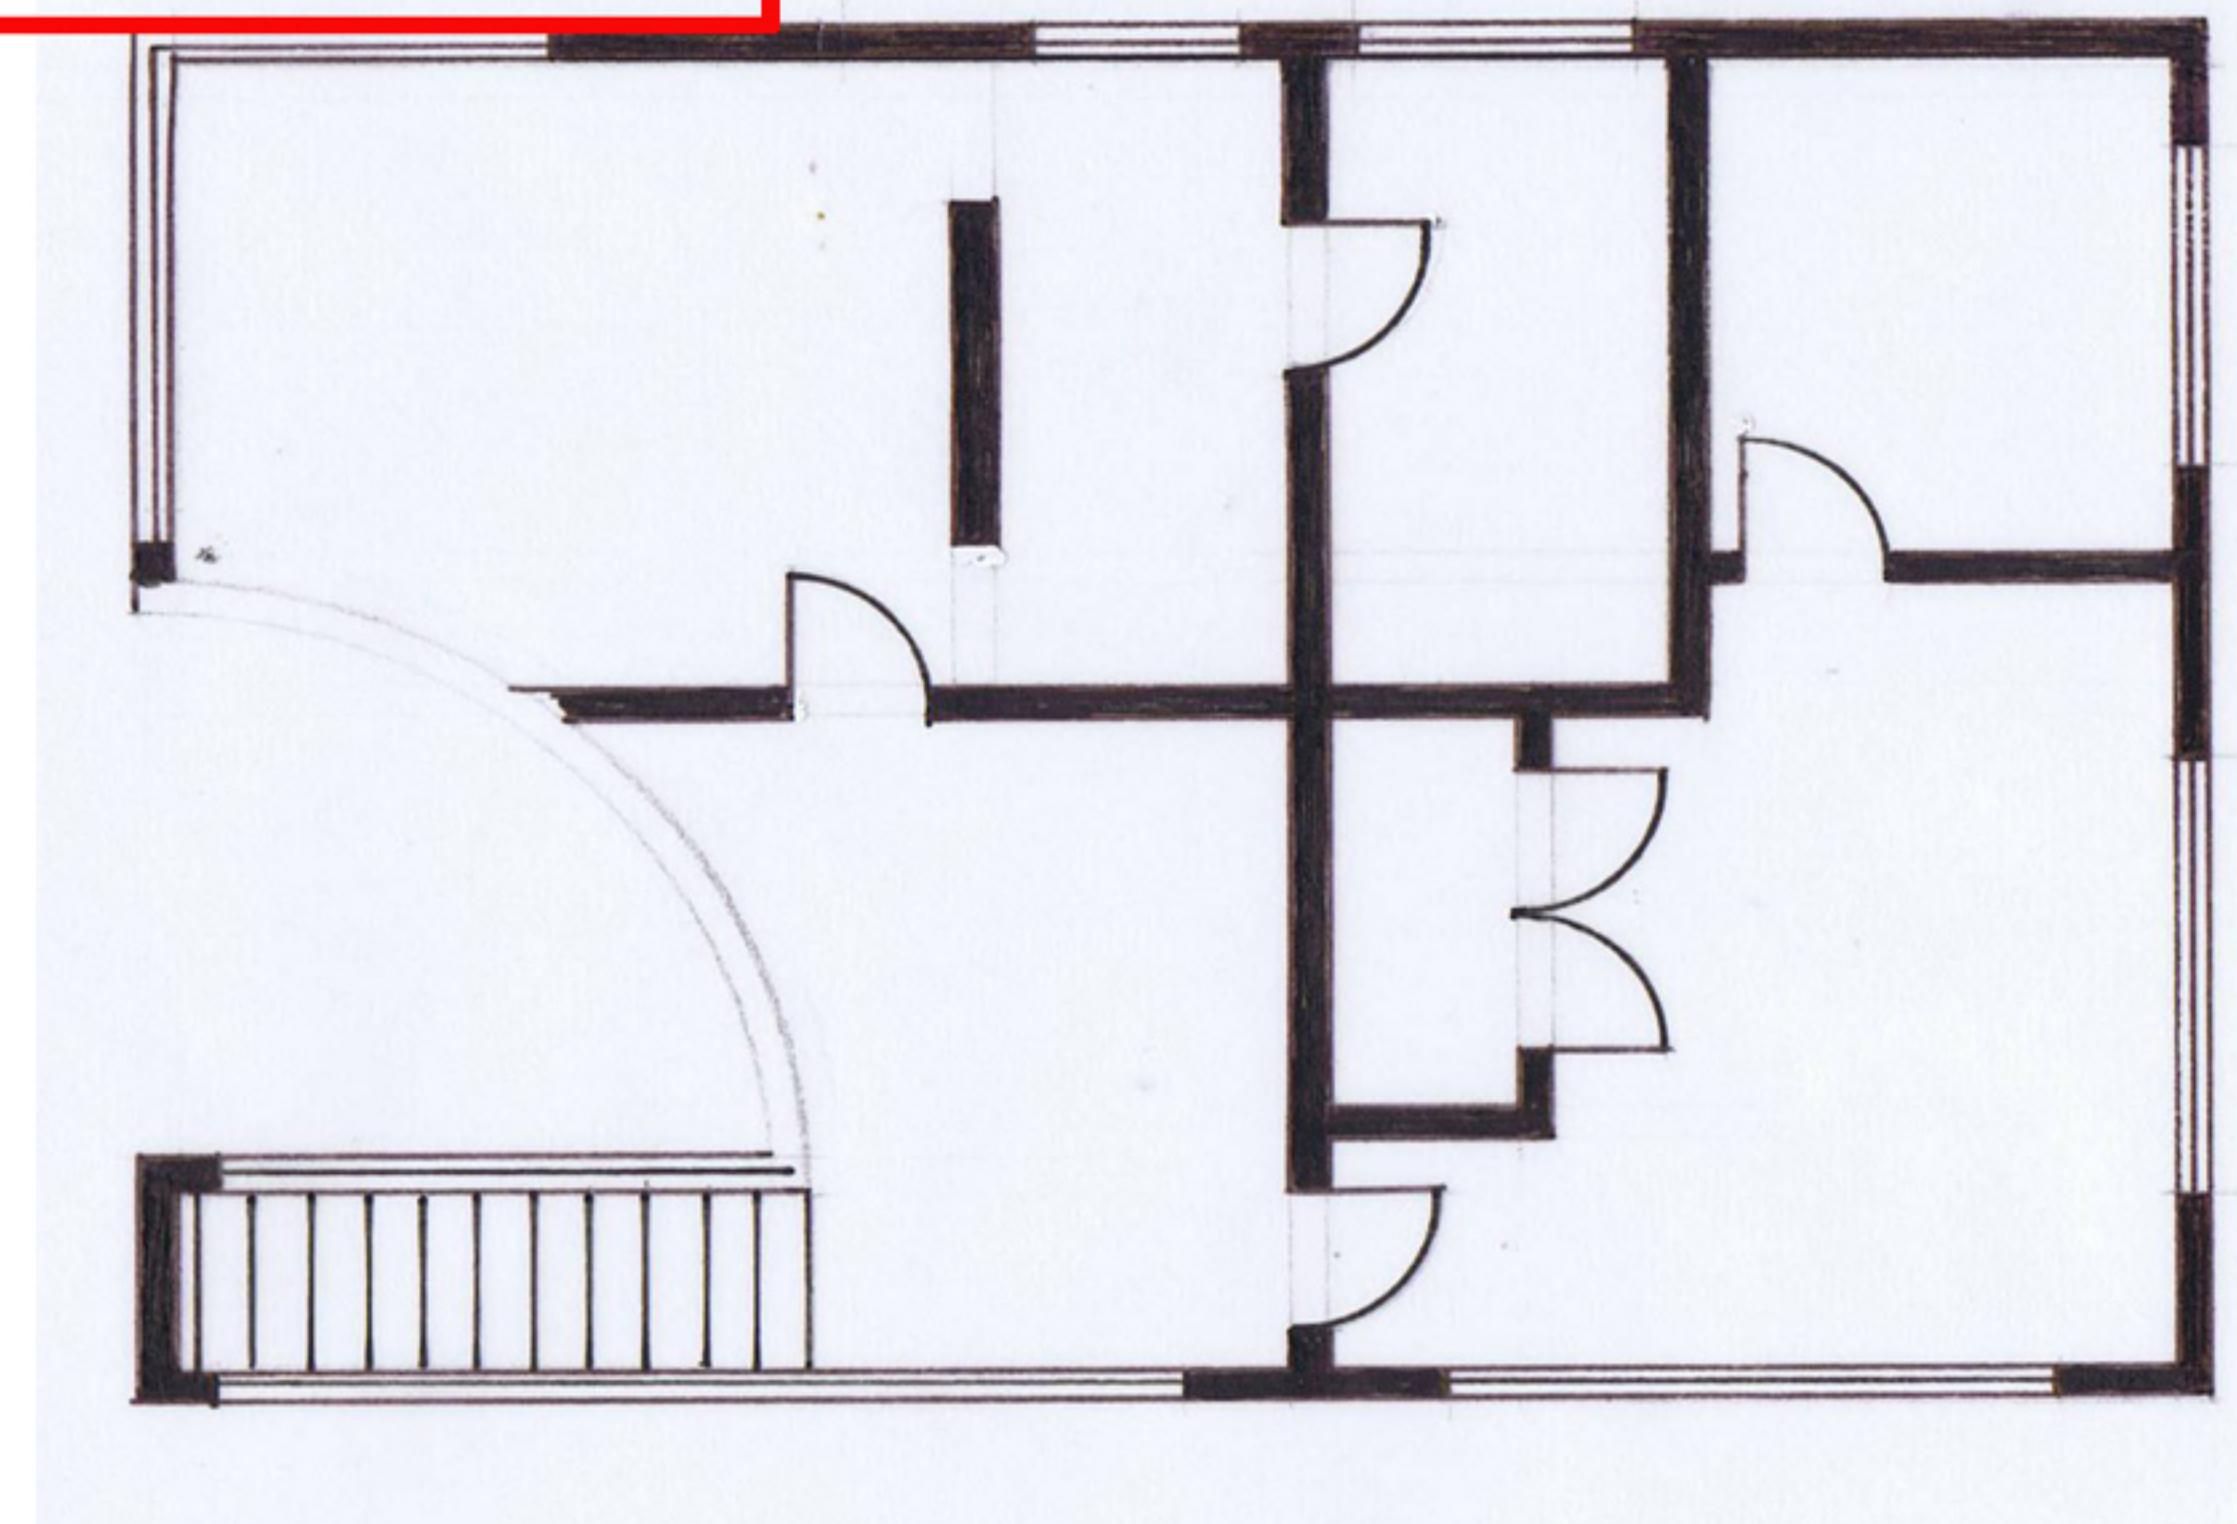

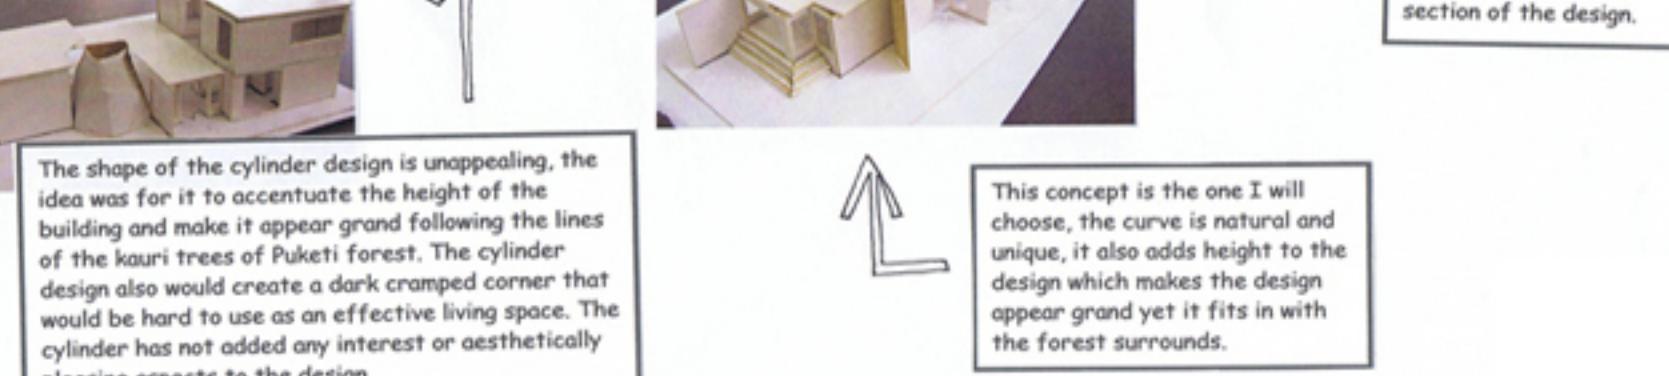

In this design I have tried to create a feeling of extra space through once again the use of large glass panels, this pushes the boundaries of the home, gaining a grander feel. Converting the living room into an open breezeway. Thus you live simultaneously indoors and outdoors. This creates an environment which usher's the outdoor weather in. In relation to Niemeyer's style, this design softens the corners to the courtyard which softens the impact of the courtyard. Also Niemeyer's traditionally allowed/hated the environment which his buildings sit in to influence the style of the house, I have used this concept to influence the exterior in this design, through the courtyard which makes the house feel more like a covered pavilion and extends the living area out.

ENTRANCE VIEW

In this design the large windows expand the visual space of the house, linking the two spaces with large windows emphasises the feel of the outdoors being inside and the inside outside. Blurring the line between the exterior and interior further. The curved lines of the design softens the buildings impact on the environment, it sits into its surroundings. In relation to Niemeyer's style, this design softens the corners to the courtyard which softens the impact of the courtyard. Also Niemeyer's traditionally allowed/hated the environment which his buildings sit in to influence the style of the house, I have used this concept to influence the exterior in this design, through the courtyard which makes the house feel more like a covered pavilion and extends the living area out.

The mock-up I have produced relates to my designer because of the curves I have used throughout the design. The curves are representative of Oscar Niemeyer's design philosophy of "disregarding the right angle and rationalist architecture designed with ruler and square to boldly enter the world of curves". I have also related my design to Niemeyer's work because his buildings are characterised as being 'spacious'. I feel that my design has flow in the bottom story, featuring a large open plan living area combined with the kitchen. However I feel that by placing the dining area with the living room I have made the space too informal, I think that the dining room should be moved so it's more in its own area and as one with the kitchen. I also feel that the top story where the bedrooms are situated is too divided, I would like the rooms to be larger and more spacious thus echoing the rest of the house and Niemeyer's style. This design has good indoor outdoor flow, with big bi-folding doors and large windows which provides more than enough lighting into each room. Along with this the indoor courtyard means that the outdoor Puketi forest environment is effectively brought inside so that the house is more at one with its environment. Despite this I feel that to integrate with the forest environment better and to channel Niemeyer's style the house design should feature more curves.

INTERIOR FINISHING

Evaluation: Design brief: Suit the environment of the Puketi forest, relate to Oscar Niemeyer, lounge, dining, bedrooms, highlights views, suitable materials.

In my design process I have been careful to make sure that the end product would sit comfortably and not impose on the natural Puketi forest environment. I believe I have met this specification through the use of split levels and split roof levels which softens the look of the house and make it easier to gradually move up to one level at a time. I have chosen to do this as my design influences me to maintain the design brief as his dominant use of curves and design philosophies of 'disregarding the right angle' forced me to continually evaluate the shapes I used to form the design thus producing a more natural shape to the house which enables it to more easily fit into the Puketi forest environment. In particular the large enclosed areas means that it is much easier to move around the house to 'reach out' into its surrounding areas. The use of stone maintains the natural aesthetics. Along with this the final touches in cladding has enabled this design to both assimilate into its environment while upholding a modern look. The dominant use of wooden cladding relates to the surrounding forest environment, the material, colour, and natural aging of wood means that it is much more suitable for the terrain of the Puketi forest environment. Emphasising the use of wood in the construction of this house to suit the forest environment is the wooden framing used for doors and windows, this softens the barrier between the indoor and outdoor forest environment, coupled with the large expansive windows means that as an occupant you feel as if you are part of the outdoor environment.

Thus I have reached a compromise I feel with Niemeyer's philosophies of allowing 'function to follow curve' curves are made into features within my design and where possible they are used to soften the appearance of objects in order for the design to sit into its environment well. Another important factor was the use of natural concrete in his design process that was regarded as revolutionary and modern at the time of its dominance in architecture. I have used this material to contrast with the wooden aspects of my design to enable it to feel solid and long standing as a design. I have also upheld the design brief in terms of providing a lounge space, in my design there is one main open lounge space which opens out through glass doors and windows to the surrounding forest environment. The central middle of the design means that my lounge area sits for all types of weather and has a welcoming and open feeling, it is multi useful. Again I have stuck to the design brief and created a dining area which is adjacent to the kitchen; this means that the preparation of food is part of the dining experience thus creating a more enjoyable atmosphere. The dining area also has large windows and opens out onto a balcony overlooking the surrounding forest environment. The eating area is a light airy feel. This design has two bedrooms which means the design is not just suited to a large family however the bedrooms are large and spacious and both have their own ensuite. They are situated upstairs away from the living spaces which means that they have privacy and are not affected by too much noise.

A separate entrance means that people do not need to travel up stairs and enters a 'tucked' corner which is created by the curved wall which is the middle of the design. This means that my lounge area sits for all types of weather and has a welcoming and open feeling, it is multi useful. Again I have stuck to the design brief and created a dining area which is adjacent to the kitchen; this means that the preparation of food is part of the dining experience thus creating a more enjoyable atmosphere. The dining area also has large windows and opens out onto a balcony overlooking the surrounding forest environment. The eating area is a light airy feel. This design has two bedrooms which means the design is not just suited to a large family however the bedrooms are large and spacious and both have their own ensuite. They are situated upstairs away from the living spaces which means that they have privacy and are not affected by too much noise.

Large windows in this design make the most of the surrounding forest environment views creating as indoor outdoor fluidity to the design, taking in all aspects of the encompassing forest environment. As mentioned earlier the materials used for this design are relevant to its surroundings, the wooden weatherboards are natural and weathered in white, this means that they are more durable and able to withstand the elements. The use of corrugated iron for roofing means that the design has a long lasting easy to clean roof that withstands against many different weather types and is relatively fire retardant while is critical in a forest environment. Altogether I am confident I have met the design brief.
