## Equation of comet

units in million kilometres

focus (0,0) focal length = 320 million km centre (320,0)

$$-y^2 = 4a(x-x_1)$$

$$-y^{2} = 4a(x-x_{1}) -y^{2} = 4 \times 320(x-320)$$
  
-y^{2} = 1280(x-320) y^{2} = -1280(x-320)

$$-v^2 = 1280(x-320)$$

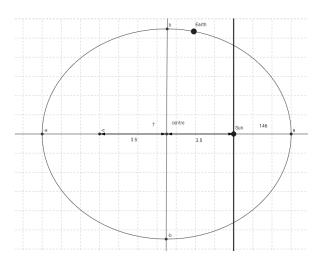

$$v^2 = -1280(x - 320)$$

Equation for the earth

(0,0) and (7,0)

closest earth gets to sun 146 million km

$$a = 149.5$$

$$b = ?$$

$$c = 3.5$$

a = 149.5 b = ? c = 3.5 
$$b^2 = a^2 - c^2$$

$$b^2 = 149^2 - 3.5^2 = 22188.75$$
 b = 148.9589 = 149 million km

$$\frac{(x-x_1)^2}{a^2} + \frac{y^2}{b^2} = 1$$

$$\frac{(x+3.5)^2}{140.5^2} + \frac{y^2}{140^2} = 1$$

$$\frac{(x-x_1)^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad \frac{(x+3.5)^2}{149.5^2} + \frac{y^2}{149^2} = 1 \qquad \frac{(x+3.5)^2}{22350.25} + \frac{y^2}{22188.75} = 1$$

When the asteroid crosses the orbit of the comet it is 640 million kms from the sun x = 0  $y^2 = -1280(0-320) = 409600$ y = 640 million km

When the asteroid crosses the orbit of the earth x = 0

$$\frac{(x+3.5)^2}{149.5^2} + \frac{y^2}{149^2} = 1$$
 
$$\frac{(0+3.5)^2}{149.5^2} + \frac{y^2}{149^2} = 1$$

$$\frac{(0+3.5)^2}{149.5^2} + \frac{y^2}{149^2} = 1$$

$$5.4809 \times 10^{-4} + \frac{y^2}{149^2} = 1$$
  $\frac{y^2}{149^2} = -5.4809 \times 10^{-4}$ 

$$\frac{y^2}{140^2} = -5.4809 \times 10^{-4}$$

$$y^2 = -12.168$$
  $y =$
